The concept of “**delivery**” in Nigerian cities still falls below excellent standard with deliveries restricted to food or long distance couriers, small scale businesses or individuals who have parcels usually resort to unstable delivery methods or make the task of delivering themselves. Dropster is a easy solution that tackles the sending and recieving of a package in the easiest way possible.

In reality, some delivery companies exsist. Problem is, their communication methods have not been updated from text messages and phone calls and users have no control over any aspect of the process. Dropster is leveraging on the existing systems and data to create and connect users and their main goals easily.

My approach was to code a clean visual interface that prioritized the users main goals and activity, which is to send easily and recieve easily on their own terms. The app also has value added features such as payment, account managent and live tracking.

7. Getting Started

New users should quickly pass by an intuitive onboarding process while having multiple login options for ease and convenience

MY DOCTOR

Role:
Mobile Developer

Type:
Mobile App

Client:
Eezy Limited

Tools
Flutter

Project
Mobile app

My Doctor is a comprehensive tele-medicine solution to address prevalent cases of misdiagnosis in Africa by giving users quality medical opinion from experts around the world and an opportunity for patients to interact with renowned specialists easily and at a fraction of the cost.

It proposes to deliver a simple, digital, comprehensive offer with several key building blocks such as Remote Care, Laboratory Services, Pharmaceutical Services and Access to network of professionals at discounted prices all within a single application.

The user app was made to reduce free-text user inputs to a minimum as people might give misleading information when asked to explain their symptoms. An emergency button was also made available triggered in cases where patients cannot go through the usual process to seek help.

The user is also profiled correctly so that practitioners have a good knowledge of the patients medical and physical records before attempting to diagnose and recommend treatment to patients. Fitting all these features into an easy-to-use app was a daunting task, here's how i handled it ;)

Doctor being able to easily view the case of a patient on the app and communicate with them via call, text or video chat
